                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
"Identification of a new family of human epithelial protein kinases containing two leucine/isoleucine-zipper domains.";

Eur. J. Biochem. 213:701-710(1993).
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- TISSUE SPECIFICITY: EXPRESSED IN BRAIN AND SKELETAL MUSCLE.
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
MAP KINASE KINASE KINASE SUBFAMILY.
-!- SIMILARITY: CONTAINS 1 SH3 DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12;

"Identification of a soluble human GITR splicing (hGITR-D).";
"Identification of a soluble human GITR splicing (hGITR-D).";
Submitted (MAR-2000) to the EMBL/GenBank/DDBD datebases.
-!- FUNCTION: RECEPTOR FOR THYSPIS. SEEMS TO BE INVOLVED IN
INTERACTIONS BETWEEN ACTIVATED T LYMPHOCYTES AND ENDOTHELIAL CELLS
AND IN THE REGULATION OF T CELL RECEPTOR-MEDIATED CELL DEATH.
MEDIATED NF-KAPPA-B ACTIVATION IN THE TRAFZ/NIK PATHWAY.
-!- SUBUNIT: BINDS TO TRAFI (THY RECEPTOR-ASSOCIATED FACTOR 1), TRAFZ,
AND TRAF3, BUT NOT TRAFS AND TRAF6.
-!- SUBCELLULAR LOCATION: Type I membrane protein (isoform 1);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kwon B., Yu K.-Y., Ni J., Yu G.-L., Jang I.-K., Kim Y.-J., Xing L., Liu D., Wang S.-X., Kwon B.S.; "Identification of a novel activation-inducible protein of the tumor

                                                                                                                                                                                          (POTENTIAL).

-- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN (LONG FORM) AND SECRETED (SHORT PORM).

-- ALTERNATIVE PRODUCTS: TWO FORMS, A LONG TRANSMEMBRANE FORM AND A SHORT SECRETED FORM, EXIST DUE TO ALTERNATIVE SPLICING.

-- ITSSUES PRESCRIFICITY: EPITHELIAL TISSUES AND BRAIN.

-- DOMAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITH THE SH2 OR SH3 DOMAINS OF MANY SIGNAL-TRANSDUCING PROTEINS.

-- PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES AND PROMOTES ITS ASSOCIATION WITH THE P85 SUBUNIT OF PHOSPHATIDYLINGSITOL 3-KINASE (BY SIMILARITY).

-- DISEASE: OVEREXPRESSED IN A SUBSET OF HUMAN MAMMARY TUMORS.

-- SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RECEPTOR PROTEIN-TYROSINE KINASE ERBB-3.

Ogawa A., Takeda T.;
"The gene encoding the heat-stable enterotoxin of Vibrio cholerae is flanked by 123-base pair direct repeats.";
Microbiol. Immunol. 37:607-616 (1993).
-! SIMILARITY: BELONGS TO THE HEAT-STABLE ENTEROTOXIN FAMILY.
-! CAUTION: THIS TOXIN IS ONLY EXPRESSED IN SOME VIBRIO STRAINS. MOST SEROTYPE-O1 STRAINS DO NOT EXPRESS THIS TOXIN.

FUNCTION: INHIBITS GASTROINTESTINAL MOTILITY AND GASTRIC ACID SECRETION. COULD FUNCTION AS A STRUCTURAL COMPONENT OF GASTRIC MUCUG, POSSIBLY BY STABILIZING GIYCOPROTEINS IN THE MUCUS GEL THROUGH INTERACTIONS WITH CARBOHYDRATE SIDE CHAINS.
SUBCELLULAR LOCATION: SECRETED THE DIGESTIVE TRACT, WHERE IT WAS FOUND PREDOMINANTLY IN THE STOWAGE WITH HIGHEST EXPRESSION IN THE AWNRUM. IT IS SECRETED PREDOMINANTLY FROM ANTRAL MUCOUS CELLS INTO THE LUMEN OF THE GASTROINTESTINAL TRACT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "A novel androgen-regulated gene, PMEPA1, located on chromosome 20q13 exhibits high level expression in prostate."; Genomics 66:257-263(2000).

Direct Submission

Direct Submission

Submitted (129-MAR-2001) Sanger Centre, Hinxton, Cambridgeshire,
CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk

On Nov 27, 2000 this sequence version replaced gi:10198636.

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
requests: clonered of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone name. Note that the
variation annotation may not be found in the sequences with
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:

IMPORTANT: This sequence is not the entire insert of clone
RP1-172H20 It may be shorter because we sequence overlapping
sections only once, except for a 100 base overlap.
The true right end of clone RP1-10112 is at 100 in this sequence. The true right end of clone RP1-21012 is at 28594 in this sequence. The true right end of clone RP1-21012 is at 100 in this sequence. This true right end of clone RP1-21012 is at 100 in this sequence. This requence was made to resolve all sequenced all regions were either double-stranded or sequenced noted all regions were either double-stranded or sequenced or sequenced by at least one plasmid subclone and the assembly was confirmed by restriction digest.
RP1-17H20 is from the library RPC1-1 constructed by the group of Pleter de Jong. For further details see
